Android MySQL Tutorial to Perform Basic CRUD Operation

October 24, 2015 by [Belal Khan](#) – [97 Comments](#)

I got mails regarding Android MySQL Connection Problems. So I am writing this tutorial. In this Android MySQL Tutorial we will cover the basic CRUD (Create, Read, Update and Delete) Operation. So that you will be able to handle MySQL Database after going through this tutorial.

Video Demonstration of the Final Output

Before moving ahead you can check this video to know what you will be creating.

Android App to Perform CRUD Operation in MySQL Data...

Prerequisites - Android MySQL Tutorial

- Android Studio (Though you can do the same with eclipse)
- Wamp / Xamp Server (You can also use a live hosting server)

Creating the MySQL Database

☐ Check All With selected: Browse Change Drop Primary Unique Index

Employee Table

- As you can see I have a table named **employee** with 4 columns (id, name, designation, salary). Id is set auto increment and primary key so we do not need to insert id.
- Now we will create our php scripts.

Creating PHP Scripts

- The first thing we need is to connect to the database. So create a file named **dbConnect.php** and write the following code.

```

1 <?php
2 /*
3  author: Belal Khan
4  website: https://www.simplifiedcoding.net
5
6  My Database is androidodb
7  you need to change the database name rest the things are default if you are using wamp or xampp server
8  You may need to change the host user name or password if you have changed the defaults in your server
9  */
10
11 //Defining Constants
12 define('HOST','localhost');
13 define('USER','root');
14 define('PASS','');
15 define('DB','androidodb');
16
17 //Connecting to Database
18 $con = mysqli_connect(HOST,USER,PASS,DB) or die('Unable to Connect');
```

- Now in CRUD the first thing is to insert data (Create)
- So create a file name **addEmp.php**. This script will add an employee.

```

1 <?php
2 if($_SERVER['REQUEST_METHOD']=='POST'){
3
4  //Getting values
5  $name = $_POST['name'];
6  $desg = $_POST['desg'];
7  $sal = $_POST['salary'];
8
9  //Creating an sql query
10 $sql = "INSERT INTO employee (name,designation,salary) VALUES ('$name','$desg','$sal')";
11
12 //Importing our db connection script
```

SIMPLIFIED CODING

[ABOUT](#)[CONTACT US](#)[WRITE FOR US](#)[ADVERTISE](#)

```
22 //Closing the database
23 mysqli_close($con);
24 }
```

- Now after adding an employee we will fetch the name and id of all the employees. So that user can select a particular employee to see all the details of that employee.
- For this create a new file named **getAllEmp.php** and write the following code.

```
1 <?php
2 //Importing Database Script
3 require_once('dbConnect.php');
4
5 //Creating sql query
6 $sql = "SELECT * FROM employee";
7
8 //getting result
9 $r = mysqli_query($con,$sql);
10
11 //creating a blank array
12 $result = array();
13
14 //looping through all the records fetched
15 while($row = mysqli_fetch_array($r)){
16
17 //Pushing name and id in the blank array created
18 array_push($result,array(
19 "id"=>$row['id'],
20 "name"=>$row['name']
21 ));
22 }
23
24 //Displaying the array in json format
25 echo json_encode(array('result'=>$result));
26
27 mysqli_close($con);
```

- Now we need to display a selected employee. For this create a new file named **getEmp.php** and write the following code.

```
1 <?php
2
3 //Getting the requested id
4 $id = $_GET['id'];
5
6 //Importing database
7 require_once('dbConnect.php');
8
9 //Creating sql query with where clause to get an specific employee
10 $sql = "SELECT * FROM employee WHERE id=$id";
11
12 //getting result
13 $r = mysqli_query($con,$sql);
14
15 //pushing result to an array
16 $result = array();
17 $row = mysqli_fetch_array($r);
18 array_push($result,array(
19 "id"=>$row['id'],
```

 search this website

SIMPLIFIED CODING

[ABOUT](#)[CONTACT US](#)[WRITE FOR US](#)[ADVERTISE](#)

- Now in CRUD we have completed (**C**-Create (Insert) and **R**-Read(Fetch)) the next is **U**-Update. We may need to update the details of an existing employee. For this create a new file named **updateEmp.php** and write the following code.

```

1 <?php
2 if($_SERVER['REQUEST_METHOD']=='POST'){
3     //Getting values
4     $id = $_POST['id'];
5     $name = $_POST['name'];
6     $desg = $_POST['desg'];
7     $sal = $_POST['salary'];
8
9     //importing database connection script
10    require_once('dbConnect.php');
11
12    //Creating sql query
13    $sql = "UPDATE employee SET name = '$name', designation = '$desg', salary = '$sal' WHERE id = $id;";
14
15    //Updating database table
16    if(mysqli_query($con,$sql)){
17        echo 'Employee Updated Successfully';
18    }else{
19        echo 'Could Not Update Employee Try Again';
20    }
21
22    //closing connection
23    mysqli_close($con);
24 }

```

- Now the final thing which is **D**-Delete. We may need to delete an existing employee. For this create a new file named **deleteEmp.php** and write the following.

```

1 <?php
2 //Getting Id
3 $id = $_GET['id'];
4
5 //Importing database
6 require_once('dbConnect.php');
7
8 //Creating sql query
9 $sql = "DELETE FROM employee WHERE id=$id;";
10
11 //Deleting record in database
12 if(mysqli_query($con,$sql)){
13     echo 'Employee Deleted Successfully';
14 }else{
15     echo 'Could Not Delete Employee Try Again';
16 }
17
18 //closing connection
19 mysqli_close($con);

```

- Now that's all we have created all the scripts for CRUD operation. Now we need the address of these scripts. In my case I am using wamp server. And my server is running in my ip -> <http://192.168.94.1>

 search this website

[ABOUT](#) [CONTACT US](#) [WRITE FOR US](#) [ADVERTISE](#)

- This is for my case. You have to know the correct url according to your system. Now thats all for the server side part. Lets move to **android studio**.

Creating an Android Studio Project

- Create a new **Android Studio** project. For this Android MySQL Tutorial I have created my project named **MySQLCRUD**.
- In this Android MySQL Application we will be performing some network operations we need internet permission. So add internet permission to your manifest file.

```
1 <uses-permission android:name="android.permission.INTERNET" />
```

- Now create a new java class inside your package named **Config**. And write the following code.

```
1 package net.simplifiedcoding.mysqlcrud;
2
3 /**
4  * Created by Belal on 10/24/2015.
5  */
6 public class Config {
7
8     //Address of our scripts of the CRUD
9     public static final String URL_ADD="http://192.168.94.1/Android/CRUD/addEmp.php";
```

SIMPLIFIED CODING

[ABOUT](#)[CONTACT US](#)[WRITE FOR US](#)[ADVERTISE](#)

```

18     public static final String KEY_EMP_DESG = "desg";
19     public static final String KEY_EMP_SAL = "salary";
20
21     //JSON Tags
22     public static final String TAG_JSON_ARRAY="result";
23     public static final String TAG_ID = "id";
24     public static final String TAG_NAME = "name";
25     public static final String TAG_DESG = "desg";
26     public static final String TAG_SAL = "salary";
27
28     //employee id to pass with intent
29     public static final String EMP_ID = "emp_id";
30 }

```

- We will create a separate class for handling our networking request. So create a new class inside your package named **RequestHandler**. And write the following code.

```

1 package net.simplifiedcoding.mysqlcrud;
2
3 import java.io.BufferedReader;
4 import java.io.BufferedWriter;
5 import java.io.InputStreamReader;
6 import java.io.OutputStream;
7 import java.io.OutputStreamWriter;
8 import java.io.UnsupportedEncodingException;
9 import java.net.HttpURLConnection;
10 import java.net.URL;
11 import java.net.URLEncoder;
12 import java.util.HashMap;
13 import java.util.Map;
14
15 import javax.net.ssl.HttpsURLConnection;
16
17 /**
18  * Created by Belal on 10/24/2015.
19  */
20
21 public class RequestHandler {
22
23     //Method to send httpPostRequest
24     //This method is taking two arguments
25     //First argument is the URL of the script to which we will send the request
26     //Other is an HashMap with name value pairs containing the data to be send with the request
27     public String sendPostRequest(String requestURL,
28                                   HashMap<String, String> postDataParams) {
29
30         //Creating a URL
31         URL url;
32
33         //StringBuilder object to store the message retrieved from the server
34         StringBuilder sb = new StringBuilder();
35         try {
36             //Initializing Url
37             url = new URL(requestURL);
38
39             //Creating an httlurl connection
40             HttpURLConnection conn = (HttpURLConnection) url.openConnection();
41
42             //Configuring connection properties
43             conn.setReadTimeout(15000);
44             conn.setConnectTimeout(15000);
45             conn.setRequestMethod("POST");
46             conn.setDoInput(true);
47             conn.setDoOutput(true);

```

- For our application we will need two more activities other than our **MainActivity**. One is to show the list of all employee from where user can select a particular employee to see. And the other one is to show the details of selected employee from where we can update and delete the employee as well. And from the **MainActivity** we will add an employee. So before going further create two more activities named **ViewAllEmployee** and **ViewEmployee**.
- Now for **activity_main.xml** create the following layout

- Use the following xml code for the above layout

```

1 <LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
2   xmlns:tools="http://schemas.android.com/tools" android:layout_width="match_parent"
3   android:orientation="vertical"
4   android:layout_height="match_parent" android:paddingLeft="@dimen/activity_horizontal_margin"
5   android:paddingRight="@dimen/activity_horizontal_margin"
6   android:paddingTop="@dimen/activity_vertical_margin"
7   android:paddingBottom="@dimen/activity_vertical_margin" tools:context=".MainActivity">
8
9   <TextView
10      android:layout_width="wrap_content"
11      android:layout_height="wrap_content"
12      android:text="Employee Name" />
13
14   <EditText
15      android:layout_width="match_parent"
16      android:layout_height="wrap_content"
17      android:id="@+id/editTextName" />
18
19   <TextView
20      android:layout_width="wrap_content"
21      android:layout_height="wrap_content"
22      android:text="Designation" />
23
24   <EditText
25      android:layout_width="match_parent"
26      android:layout_height="wrap_content"
27      android:id="@+id/editTextDesg" />
28
29   <TextView
30      android:layout_width="wrap_content"
31      android:layout_height="wrap_content"
32      android:text="Salary" />
33
34   <EditText
35      android:layout_width="match_parent"

```

29         super.onCreate(savedInstanceState);
30         setContentView(R.layout.activity_main);
31
32         //Initializing views
33         editTextName = (EditText) findViewById(R.id.editTextName);
34         editTextDesg = (EditText) findViewById(R.id.editTextDesg);
35         editTextSal = (EditText) findViewById(R.id.editTextSalary);
36
37         buttonAdd = (Button) findViewById(R.id.buttonAdd);
38         buttonView = (Button) findViewById(R.id.buttonView);
39
40         //Setting listeners to button
41         buttonAdd.setOnClickListener(this);
42         buttonView.setOnClickListener(this);
43     }
44
45     //Adding an employee
46     private void addEmployee(){
47
48         final String name = editTextName.getText().toString().trim();
49         final String desg = editTextDesg.getText().toString().trim();
50         final String sal = editTextSal.getText().toString().trim();
51
52         class AddEmployee extends AsyncTask<Void,Void,String>{
```

SIMPLIFIED CODING

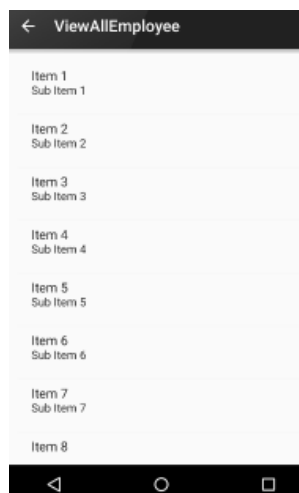

[ABOUT](#)[CONTACT US](#)[WRITE FOR US](#)[ADVERTISE](#)

```

63         @Override
64         protected void onPostExecute(String s) {
65             super.onPostExecute(s);
66             loading.dismiss();
67             Toast.makeText(MainActivity.this,s,Toast.LENGTH_LONG).show();
68         }
69
70         @Override
71         protected String doInBackground(Void... v) {
72             HashMap<String,String> params = new HashMap<>();
73             params.put(Config.KEY_EMP_NAME,name);
74             params.put(Config.KEY_EMP_DESG,desg);
75             params.put(Config.KEY_EMP_SAL,sal);
76
77             RequestHandler rh = new RequestHandler();
78             String res = rh.sendPostRequest(Config.URL_ADD, params);
79             return res;
80         }
81     }
82
83     AddEmployee ae = new AddEmployee();
84     ae.execute();
85 }
86
87 @Override
88 public void onClick(View v) {
89     if(v == buttonAdd){
90         addEmployee();
91     }
92
93     if(v == buttonView){
94         startActivity(new Intent(this,ViewAllEmployee.class));
95     }
96 }
97 }

```

- Now from this activity we will move to the activity **ViewAllEmployee**. So create the following layout in ViewAllEmployee's layout file which is **activity_view_all_employee.xml**.
- In this activity we will create a **ListView** only.

SIMPLIFIED CODING

[ABOUT](#)[CONTACT US](#)[WRITE FOR US](#)[ADVERTISE](#)

```

6      android:paddingTop="@dimen/activity_vertical_margin"
7      android:paddingBottom="@dimen/activity_vertical_margin"
8      tools:context="net.simplifiedcoding.mysqlcrud.ViewAllEmployee">
9
10
11     <ListView
12         android:layout_width="match_parent"

15
16
17 </LinearLayout>

```

- Because we are creating a **ListView**, we need one more Layout Resource File for our ListView. Inside layouts create a new xml file named **list_item.xml** and write the following code.

```

1 <?xml version="1.0" encoding="utf-8"?>
2 <LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
3     android:orientation="vertical" android:layout_width="match_parent"
4     android:layout_height="match_parent">
5
6     <TextView
7         android:id="@+id/id"
8         android:layout_width="wrap_content"
9         android:layout_height="wrap_content" />
10
11     <TextView
12         android:id="@+id/name"
13         android:layout_width="wrap_content"
14         android:layout_height="wrap_content" />
15
16 </LinearLayout>

```

- Now write the following code in **ViewAllEmployee.java**

```

1 package net.simplifiedcoding.mysqlcrud;
2
3 import android.app.ProgressDialog;
4 import android.content.Intent;
5 import android.os.AsyncTask;
6 import android.support.v7.app.AppCompatActivity;
7 import android.os.Bundle;
8 import android.view.Menu;
9 import android.view.MenuItem;
10 import android.view.View;
11 import android.widget.AdapterView;
12 import android.widget.ListAdapter;
13 import android.widget.ListView;
14 import android.widget.SimpleAdapter;
15 import android.widget.Toast;
16
17 import org.json.JSONArray;
18 import org.json.JSONException;
19 import org.json.JSONObject;
20
21 import java.util.ArrayList;
22 import java.util.HashMap;
23
24 public class ViewAllEmployee extends AppCompatActivity implements ListView.OnItemClickListener {
25

[Reply](#)

Ruddi says

October 25, 2015 at 7:34 am

If i want to create i collum in the same table called image and i store an image as a link how do i retrive that image if i want to use this tut.?

[Reply](#)

Belal Khan says

October 25, 2015 at 7:44 am

Just add a new field in json named image url .. and get the url of image.. and then with the URL you can show the image.

[Reply](#)

Ruddi says

October 25, 2015 at 9:23 am

is it possible that you can show me how?

What server you are using? A live webserver of wamp or xampp server??

[Reply](#)

achoda says

October 27, 2015 at 5:29 am

am using xampp

[Reply](#)

Belal Khan says

October 27, 2015 at 6:10 am

Then you tell me first where you are running your app in the emulator or in your phone directly..

If you are using your phone to test the app.. Then it will not work because your phone cannot access xampp directly...

Now if you are using emulator then you have to check whether your emulator can access your local server or not...

to check this first go to your command prompt if you are using windows.. then type ipconfig.. make sure your xampp server is running while doing this..

You will see many ips there

Now open browser in your android emulator.. and in the address bar

write this http://192.168.94.1/your_scripts_directory_in_htdocs

Use [hostinger.in](#) for a free hosting

Reply

achoda says

October 27, 2015 at 7:48 am

will it work with a phone.

Reply

achoda says

October 27, 2015 at 8:13 am

i have never used hostinger before, can you help me with some procedures

Reply

Belal Khan says

October 27, 2015 at 8:19 am

You can see the procedure of using hostinger here ->

<https://www.simplifiedcoding.net/php-android-tutorial-part-1/>

Hostinger will work with your phone because it is a live server and with the URL anyone can access.. You just make sure that your phone has an active internet connection..

Marco says

October 28, 2015 at 9:59 pm

Hi Belal, I can't get items. I have a php which works out just fine (it works when I open it on the browser) and I finalise it with a `print(json_encode(array($output)))`;

search this website

SIMPLIFIED CODING

[ABOUT](#)[CONTACT US](#)[WRITE FOR US](#)[ADVERTISE](#)

```
for(int i=0; i<jArray.length();i++){
JSONObject json = jArray.getJSONObject(i);
s = s +
"Value1 : "+json.getString("Value1")+"\n"+
"Value2 : "+json.getString("Value2")+"\n"+
"Value3 : "+json.getString("Value3")+"\n\n";

}

resultView.setText(s);
```

[Reply](#)

Belal Khan says

October 29, 2015 at 2:05 am

You just missed out this line

```
JSONObject jsonobject = new JSONObject(your json string);
```

```
//Then get array from this object
```

```
JSONArray array = jsonobject.getJSONArray(your array name here);
```

```
//Then run the loop
```

[Reply](#)

Marco says

October 29, 2015 at 8:09 am

Hi Belal, thanks but are you sure this is sufficient?

```
try {
String s = "";
```

SIMPLIFIED CODING

[ABOUT](#)[CONTACT US](#)[WRITE FOR US](#)[ADVERTISE](#)

```
s = s +  
"Value1 : "+json.getString("Value1")+"\n"+  
"Value2 : "+json.getString("Value2")+"\n"+  
"Value3 : "+json.getString("Value3")+"\n\n";  
  
}
```

```
resultView.setText(s);
```

still it does not work :/ Maybe the last statement should be "resultView.setText(result);" ?

[Reply](#)

Marco says

October 29, 2015 at 8:14 am

edit: neither "resultView.setText(result);" does work, how incredible is it?

[Reply](#)

Belal Khan says

October 29, 2015 at 8:28 am

you did the same thing again.. first you need to get the json object and then you can get the array..

See the code I have posted in the previous comment

Or you try downloading my project

Marco says

October 29, 2015 at 10:44 am

What about now?

Hello Friend,

First, thank you for the tutorial, continue on that path. second please ask something like this tutorial but using the library volley. third an important consultation. What do you use it?. for a database of over 1 million records. that database engine? What kind of library would use? this or volley? and why.

HI

Thanks for the tute. I am able to work all the functions i.e. RUD except 'C'. Add employee is not working for me. Is it due to some permission required or something.

Shubham Yadav says

November 4, 2015 at 5:18 pm

Hey thanks for the tutorial but i need ur help –
see i compiled my source code as per u stated but now when i am debugging / running my app its shows the errors (somewhat 40 errors) in all the three Java Class that u told us to define –

- * MainActivity
- * ViewAllEmployee
- * ViewEmployee

and for all of these classes the error is on some keywords like RequestHandler ,
sendGetRequestParam(Config.URL_DELETE_EMP, id) , Config

Errors are :

- cannot find symbol variable Config
- cannot find symbol variable KEY_EMP_SAL
- cannot find symbol class RequestHandler

etc....

For better info on exactly what the problem is i have uploaded a screenshot of IDE covering the errors and its suggestion .

<https://drive.google.com/folderview?id=0BzPcbmh7-rcvOUQwOS16QlJqN00&usp=sharing>

–

Please help me on this

That is because you forgot to create the Config class.. See the tutorial carefully and create Config.java file where these constants are stored...

You have also forgot to create the RequestHandler class.. Follow the tutorial carefully

Hi Belal

Another question:

Consider this code segment:

```
LinearLayout ll = (LinearLayout) findViewById(R.id.linear);
for (int i = 0; i < result.length(); i++) {
    JSONObject jo = result.getJSONObject(i);
    String pname = jo.getString(Config.TAG_PCKG_NAME);
    String price = rs + jo.getString(Config.TAG_PCKG_PRICE);
    String Tag= "debugger2";
    Log.i(Tag, pname);
```

```
HashMap employees = new HashMap();
employees.put(Config.TAG_PCKG_NAME, pname);
employees.put(Config.TAG_PCKG_PRICE, price);
list.add(employees);
```

Figured it out buddy, I needed to define a custom adapter in place of a simple adapter, posting the code here for the general good:

```
public class CustomAdapter extends SimpleAdapter{

    private ArrayList<HashMap> results;
    private final int[] bcgImage;
    public CustomAdapter(Context context,
        ArrayList<HashMap> data, int resource,
        String[] from, int[] to, int[] bcgImage) {
        super(context, data, resource, from, to);

        this.bcgImage = bcgImage;
        this.results = data;
    }

    @Override
    public View getView(int position, View view, ViewGroup parent) {

        View v = view;

        if (v == null) {
            LayoutInflater inflater = (LayoutInflater) parent.getContext()
                .getSystemService(Context.LAYOUT_INFLATER_SERVICE);
            v = inflater.inflate(R.layout.list_item, null);
        }

        v.setBackgroundResource(bcgImage[position]);
```

Hi Bilal,

There is one another doubt which i wanted to ask ... Suppose if we want to do this project on internet server instead of localhost. I know that all the php files along with database we have to create in online server and furthermore we have to modify code also but my doubt is that whether free hosting will allow this or not OR is there any restrictions while using free hosting. I have to do it for practice basis only ...

[Reply](#)

AMAZING TUTORIALS!!!

I really appreciate your great work Mr. Belal.

Can I make a request??

I have a table in a live server that hosts the geolocations “name, latitude, longitude” of a number of moving objects. I would like to have a code that would fetch these values periodically from my database and then be able to plot them in a google map.

could you please help me in this?

At the very least, I am in need of the code that will fetch the values and parse the JSON objects before they are passed to a loop for plotting it with google maps markers. I would like to have the php code and the android code that deals with this particular problem...

my table is of the format:

cid: INT primary key

cname: VARCHAR “name of object”

clat: DOUBLE “latitude”

clong: DOUBLE “longitude”

sid: INT “for foreign key”

Thank you very much! I really appreciate your generosity and kindness!!

Shana

Your tutorial has been a great help to a novice developer like me, Thanks for putting in the effort.

I need your advice. What do you think is the best way of implementing a Shopping cart. I have my items in a list view which on click opens a detailed page. There I have a button for add to cart. Now should I save the information into a sqlite database or should I push it back into a mysql thing on the server or just create another list with global variables (just thinking out loud). A little help will be much appreciated.

Thanks

G

I have been waiting for such tutorial so long.... but i have problem.
Pressing 'view employee' button results with blank screen.
PHP scripts on server are working corectly.
MySQL database is on online server.
It seems like adapter won't display list_item...
I'm using Gingerbread, may this be a problem?
Any ideas whats going on? Thanks.

Sir thank you so much for the tutorial. But there is a problem. I've followed all of the tutorial above (I use Android Studio and MySQL Database). But the form is blank (data did not displayed) when I clicked the listview of the data (want to change/update and delete). All of the php and android code are same like yours (I just change some of them because my app is Restaurant App, the difference is only in the variables). Can you tell me what is the problem? What should I do to fix this problem? Sorry for my English. Thank you sir.

hello belal. the tutorial is awesome, but i need to change a little bit of the coding. so instead of send id i send username.

```
Intent intent = getIntent();
```

```
user = intent.getStringExtra("user");
```

```
RequestHandler rh = new RequestHandler();
```

```
String s = rh.sendGetRequestParam(Config.URL_GET_USER,user);
```

```
return s;
```

i send session value into intend and pass here. but the info is not showing. update part is doing nice, just the retrieve problem. do you have any idea how to do it?
